Administration of Blended Diet via gastrostomy device

The policy refers to the use of blended/liquidised family food for individuals with gastrostomy devices

Key Words: PEG, liquidised, diet

Version: 4

Adopted by: Trust Policy Committee

Date this version was adopted: 7 May 2020

Name of Author: Anne Mensforth
Nutrition and Dietetic Service Manager

Name of responsible committee: Nutrition and Pressure Ulcers Group

Date issued for publication: May 2020

Review date: October 2021

Expiry date: 1 May 2022

Target audience: Registered Dietitians, Children’s community Nursing staff, Learning Disability nurses and school nurses

Type of Policy Clinical ✔ Non Clinical

Which Relevant CQC Fundamental Standards?

Regulation 9, Person centred care
Regulation 12, Safe care and treatment,
Regulation 14, Meeting nutritional and hydration needs

Equality Statement

Leicestershire Partnership NHS Trust (LPT) aims to design and implement policy documents that meet the diverse needs of our service, population and workforce, ensuring that none are placed at a disadvantage over others.

It takes into account the provisions of the Equality Act 2010 and promotes equal opportunities for all.

This document has been assessed to ensure that no one receives less favourable treatment on the protected characteristics of their age, disability, sex (gender), gender reassignment, sexual orientation, marriage and civil partnership, race, religion or belief, pregnancy and maternity.

In carrying out its functions, LPT must have due regard to the different needs of different protected equality groups in their area.

This applies to all the activities for which LPT is responsible, including policy development and review.
Due Regard

The Trusts commitment to equality means that this policy has been screened in relation to paying due regard to the Public Sector Equality Duty as set out in the Equality Act 2010 to eliminate unlawful discrimination, harassment, victimisation; advance equality of opportunity and foster good relations.

A due regard review found the activity outlined in the document to be equality neutral because requests to change to blended diet via gastrostomy apply only to patients receiving this specific type of nutrition, and need to be considered on a clinical basis.

Core Principles of the NHS Constitution – for further details please refer to the Development of Procedural Documents Policy

1.0 Summary

The document provides guidance for staff involved with patients/parents/carers wishing to receive or administer blended/liquidised diet (which will be referred to as blended diet throughout the document though the terms are interchangeable) via enteral feeding devices, in combination with, or in preference to the use of prescribed enteral feeds. Guidance is required in connection with decision-making around the potential for this feeding method to meet nutritional requirements, hygiene and infection control, patient safety requirements, and practical considerations on an individual basis. Currently this practice is likely to be used for children and young people, but may also be applicable to adults.

2.0 Introduction

The use of sterile, ready to hang feeds is considered to be the gold standard treatment for patients requiring enteral nutrition, and alongside specialist advice the use of these products may contribute to reduced hospital admissions and length of stay. Prescribed feeds are usually nutritionally complete within a specified volume, and assuming good practice guidelines are followed, rarely cause tube blockages. Despite this, there is growing interest in the use of blended diet via enteral feeding tubes as an alternative to commercially available prescribed enteral feeds in the UK (in line with other countries), with reported benefits from changing to this method of feeding including reduced vomiting and retching, improved bowel function, reduced dependence on medication, and improved general wellbeing and mood.

There has been little published evidence to inform and support safe practice in this field, though research is increasing; but the sharing of experiences via support groups and social media has raised the profile of this method of feeding, leading to increasing numbers of requests and enquiries relating to this. This is particularly the case for children and young adults, and there is recognition that some parents/carers are adopting this method of feeding irrespective of advice and support from health professionals.

The Enteral Plastic Safety Group does not endorse this method of enteral feeding practice, but states that any patient/carer wishing to make an informed choice to administer blended food via enteral feeding device should have an individualised risk assessment carried out in line with Trust policy.

An increasing number of enteral feeding device manufacturers now endorse these for the administration of blended food. These include Avanos devices – Percutaneous Endoscopic Gastrostomy tube, balloon retained gastrostomy tube and low profile devices (button). The policy is not relevant to patients with devices feeding into the small bowel. Blended food is not sterile; feeding into the bowel bypasses the protective acidic environment of the stomach.
The British Dietetic Association (BDA) advises that, for the majority of individuals, the use of commercial formula remains the first line choice, does, but acknowledges the growing use of blended diet via gastrostomy, and the need to:

- Create a culture where tube-fed individuals and their families or carers feel able to openly and honestly discuss the feeding plan they follow with their dietitian
- Create a culture where dietitians feel supported professionally, to raise the topic of blended diet and offer this option as a mode of feeding where they deem it appropriate for physiological, social or emotional reasons

https://www.bda.uk.com/improvinghealth/healthprofessionals/policy_statements/policy_statement_-_blended_diet

The BDA also advises that Dietitians should continue to fulfil their duty of care to the patient or carer; supporting them to ensure adequate nutrition is provided where they decide they wish to use blended diet via gastrostomy device.

Tube fed individuals receive input from a range of healthcare and non-healthcare professionals, including Registered Dietitians and other Allied Health Professionals, Nurses, Nursing assistants, health visitors, school and nursery staff, and respite and care agency staff. Some staff are involved in an advisory capacity, others in the administration of feeds. Administration of blended diet via gastrostomy device requires staff to be competent in enteral feed administration.

There is a need for all staff to support patients/parents/carers in adopting and maintaining safe practice where they have made an informed decision to use this mode of feeding. For adult patients, a Best Interests meeting may be required where patients lack capacity to make the decision themselves. The capacity assessment and the outcome of the meeting should be documented in the patient record, and made available to all relevant staff.

Duties

Dietitians will:

- be aware that the use of blended diet may provide clinical benefit in certain patient groups
- undertake risk assessments for individuals or families wishing to change to blended diet via gastrostomy
- ensure that decisions are made in the best interests of the patient where mental capacity is in doubt. For adult patients, the dietitian will ascertain whether Power of Attorney or deputyship for health and welfare are in place.
- advise on maintaining adequate nutrition and hydration
- provide ongoing monitoring for individuals receiving blended diet, as for those receiving prescribed feeds
- direct individuals to advice on safe practice relating to hand hygiene, blended food preparation, storage, reheating of food and administration
- liaise with the relevant MDT regarding the change to blended diet
- provide a nutritional plan for staff involved in feed administration

Nursing staff, nursing assistants and other carers will:
- administer feeds (prescribed or blended family foods) in accordance with these guidelines and written nutritional plan provided by the Dietitian
- advise patients/parents/carers on safe practice relating to hand hygiene, blended food preparation, storage, reheating and administration, and support families in minimising infection control risks

3.0 Purpose

This guideline is intended to collate available information and evidence to support staff in
- responding to requests from patients/parents/carers receiving/managing enteral nutrition to wholly or partially change their prescribed enteral feed to blended diet
- ensuring patients/parents/carers fully understand the risks and disadvantages associated with this method of feeding, undertaking an individual risk assessment, and advising on mitigation where they wish to proceed
- promoting nutritional adequacy for patients receiving blended diet via gastrostomy
- providing patients/parents/carers with advice on safe processes for preparation, storage and administration of blended diet via gastrostomy.
- ensuring all decisions made by others on behalf of patients lacking mental capacity are made in the patient’s best interests

The document has been developed to promote best practice and optimise patient safety where patients/parents/carers choose to use blended diet in preference to prescribed enteral feed products

4.0 Duties within the Organisation

4.1 The Trust Board has a legal responsibility for Trust policies and for ensuring that they are carried out effectively.

4.2 Trust Board Sub-committees have the responsibility for ratifying policies and protocols.

4.2.1 Divisional Directors and Heads of Service are responsible for ensuring all
relevant staff are aware of the policy and adhere to the principles and guidelines contained within it

4.2.2 Managers and Team leaders are responsible for ensuring all relevant staff are aware of the policy and adhere to the principles and guidelines contained within it

4.2.3 Responsibility of Staff – Staff involved in advising patients/parents/carers on the use of blended diet via gastrostomy device, or handling, administering or storing blended feeds, will ensure they are familiar with the content of the policy and associated procedural guidelines, and work in accordance with these

Clinical staff must ensure that consent has been sought and obtained before any care, intervention or treatment described in this policy is delivered. Consent can be given verbally and / or in writing. Someone could also give non-verbal consent as long as they fulfil the criteria to have capacity and are able to communicate their decision in some way. Consent must be voluntary and informed and the person consenting must have the capacity to make the decision.

In the event that the patient’s capacity to consent is in doubt, clinical staff must ensure that a mental capacity assessment is completed and recorded. Someone with an impairment of or a disturbance in the functioning of the mind or brain is thought to lack the mental capacity to give informed consent if the impairment means that they cannot do one of the following:

- Understand information about the decision
- Remember that information
- Use the information to make the decision
- Communicate the decision
5.0 Process to support consideration of the use of blended diet via enteral feeding device

**Requirement for discussion relating to trial of blended diet via gastrostomy, or patient/carer informs staff that they have commenced this**

Dietitian meets with patient/parent/carer
- Discusses and documents reasons for considering change made
- Discusses other alternatives which may be considered/tried
  - Discusses potential risks and benefits
  - Establishes whether the patient has mental capacity, and whether PoA or deputyship is in place

**Patient/parent/carer wishes to progress with trial, or continue blended diet. Note – best interests meeting may be needed.**

**No**
- Continue prescribed enteral feed

**Yes**
- Blended diet inappropriate
  - Continue routine nutritional monitoring at appropriate intervals

  - Agreement obtained
    - Dietitian documents decision and rationale, and advises continuing with prescribed enteral feed.
    - Agreement not obtained, patient, parent or carer wishes to use blended diet (Best Interests meeting may be needed). Safeguarding concern to be considered in this event

  - Blended diet appropriate
    - Dietitian discusses with GP / other relevant medical professional to ensure no medical contraindications
      - Undertake risk assessment using proforma (page 21)
      - Identify risks and mitigations
      - Agree any modifications to feed regimen, timings, volumes, administration methods
      - Inform patient/carer that blended diet may not be accommodated in residential care or inpatient settings
      - Continue dietetic monitoring
5.1 Feed administration
The use of Enteral feeding pumps to deliver blended foods is not supported by any manufacturer. Pump feeding of blended foods is also not recommended due to the risk of microbial contamination with protracted hanging times, and enteral feeding pumps are not calibrated for this purpose. It is therefore suggested that all feeds should be administered as boluses, using a syringe.

5.2 Nutritional adequacy
Evidence suggests there is variation between the expected and actual macro and micronutrient content of blended feeds, with actual levels being lower than calculated, particularly if the blend is sieved. The impact of this on nutritional status is unknown.
For this reason, a combination of prescribed feed and blended food should be considered if symptom control can be achieved without withdrawing all prescribed feeds, or a vitamin and mineral supplement may be required. Reliance on a limited range of foods may be detrimental to overall nutritional status and intestinal microbial diversity.
Guidance from the dietitians will be based on the Food Standards Agency Eat Well Guide, with modifications to meet individual and clinical needs. Periodic analysis of overall dietary intake may be required, alongside anthropometric measurements.
Blood tests may be requested by the dietitian if there are specific concerns regarding an individual’s nutritional intake.

5.3 Hygiene and infection prevention
It is necessary to ensure that blended food is suitable for consumption, and does not cause gastrointestinal upset due to contamination.
The potential for contamination during preparation, storage or subsequent handling of blended food has been widely acknowledged as a risk which must be mitigated through good food hygiene practice, as for regular family food.

5.3.1 Preparation
Research comparing microbial contamination of prescribed enteral feeds with blended food found counts to be significantly higher in blended foods, with counts rising to an unacceptably high level by 48 hours. This was attributed in part, to the utensils used during preparation of the blended food, particular sieves, therefore it is suggested that the practice of sieving is avoided. Prescribed enteral feeds are sterile on opening, and if handled appropriately remain sterile when administered. However, observation of the skills of carers preparing and administering modular enteral feeds in the home environment found that most carers performed poorly in respect of hand hygiene and clean preparation and handling of feeds, despite training.

5.3.2 Storage
Avoidance of storing blended foods (i.e. preparing and blending as close to administration as possible) will reduce risks associated with storage.
Where storage and re-heating is required, the Food Safety guidelines published by the Chartered Institute of Environmental Health should be adopted to minimise associated risks.

Procedural guidance on preparing, storing and re-heating food is included – See Appendix 4.

Training

Staff involved in preparation and administration of blended diet via gastrostomy devices should undertake food hygiene training provided by the Trust.

See appendix 1 for training template

There is a need for training identified within this policy. In accordance with the classification of training outlined in the Trust Learning and Development Strategy this training has been identified as / role development training.

The course directory e-source link below will identify: who the training applies to, delivery method, the update frequency, learning outcomes and a list of available dates to access the training.

http://www.leicеспart.nhs.uk/Library/AcademyCourseDirectory.pdf

A record of the event will be recorded on the Electronic Staff Record

Stakeholders and Consultation

See list of individuals to whom the policy has been circulated for comment

6. Monitoring Compliance and Effectiveness

The decision to use blended diet via in preference to prescribed enteral feeds, and the incidence of problems with gastrostomy devices and feed tolerance/gastro-intestinal problems will be documented in the relevant patients’ dietetic and nursing records if applicable, as part of core record keeping.

7. Links to Standards/Performance Indicators

A description of how the procedural document links to Care Quality Commission (CQC) Outcomes (E.g. Outcome/Regulation number and domain) or other standards/performance indicators should be included (e.g. Essence of Care, National Patient Safety Advisor Agency notices, NICE guidance).

Guidelines for preparation, storage and reheating blended feeds

Considerations for this do not differ from those relating to food for oral consumption

It is recommended that patients/parents/carers complete on-line food hygiene training

Preparation
- Good hand washing techniques must be adopted, and hands washed prior to handling food or equipment.
- Cooking and liquidising equipment should be of a design which can be thoroughly cleaned.
- Surfaces on which food is prepared must be clean
- Food must be stored appropriately to avoid deterioration prior to cooking or use
- Avoid undercooking food prior to liquidising
- Prepare blended food as close as possible to the time of administration

Storage
If it is necessary to store food in the fridge for later administration, the following guidelines should be adopted:
- Store the food in a clean container with a lid
- Blended food should not remain at room temperature for more than 90 minutes before refrigerating
- Blended food not used within 90 minutes may be refrigerated (below 5°C) and used within 24 hours of preparation
- Blended food may be frozen (below -18°C) for up to 1 month

Reheating
Feeds containing meat, poultry or previously cooked foods
Remove feed from fridge, transfer to a suitable container, and microwave until ‘steaming hot’ or ‘piping hot’ throughout (or if using a thermometer, a minimum of 70°C for at least 2 minutes). Allow to cool to body temperature (37°C) or below before feeding

Feeds not containing meat, poultry or previously cooked foods
Option 1 – remove feed from fridge and stand on work surface for 30 minutes to allow this to come to room temperature (WHO 2007)
Option 2 – remove feed from fridge and place the container in a jug of hot water for no more than 10 minutes. Shake or stir before feeding

Defrosting
Frozen food should be thawed in the fridge below 5°C, reheated in accordance with information above, and used within 24 hours of removing from the freezer
### Appendix 6

**Leicestershire Home Enteral Nutrition Service**

**Blended diet via gastrostomy device - risk assessment**

Name........................................................................................................... NHS number........................................................................................................... DOB..........................................................................................................

Prior to completing the risk assessment it should be confirmed that the patient/parent/carer has a full understanding of the implications and requirements of this method of feeding.

| Feed administration | Risk relates to:  
  - thicker consistency of blended meals  
    a) It is unlikely that gravity bolus feeding will be practical  
    b) Pump feeding is not recommended  
  Pumps are not calibrated for this consistency of feed. Blended meals may not remain in suspension for a prolonged period of time  
  Increased infection risk from prolonged ‘hanging’ time  
  Potential uneven or over-heating of feed, if feeds are warmed | Administration using syringe with plunger will be needed (caution relating to the pressure applied)  
If feed is warmed/reheated, ensure the temperature does not exceed hand temperature when administered, and the food is re-mixed after warming | |

| Tube blockage       | Risk could arise from:  
- Food being incompletely blended  
- Attempts to administer a solution which is too thick | Ensure feed is completely smooth  
Flush tube immediately after all feeds  
Ensure feed is adequately diluted to a suitable consistency |           |

Recommendations/summary

Dietitian ................................................................. Date..............................................

Patient/parent/family .................................................. Date..............................................

To be filed in dietetic records and the records of other services involved, as applicable
Data Privacy impact assessment (DPIAs) are a tool which can help organisations identify the most effective way to comply with their data protection obligations and meet Individual's expectations of privacy.

The following screening questions will help the Trust determine if there are any privacy issues associated with the implementation of the Policy. Answering 'yes' to any of these questions is an indication that a DPIA may be a useful exercise. An explanation for the answers will assist with the determination as to whether a full DPIA is required which will require senior management support, at this stage the Head of Data Privacy must be involved.

### Name of Document:
Administration of Blended Diet via gastrostomy device

### Completed by:
Anne Mensforth

### Job title
Clinical Dietetic Manager

### Date 1.10.19
